

1. Title and abstract

Diagnostic accuracy of test T for detecting condition C: a prospective cohort study.

2. Methods

Data collection was planned prospectively, before either the index test or the reference standard were performed.

Adults presenting with suspected condition C at the participating clinic were eligible.

The index test was performed by a blinded technician using a standardised protocol.

The reference standard was histopathological confirmation.

3. Results

Figure 1 shows the flow of participants through the study.

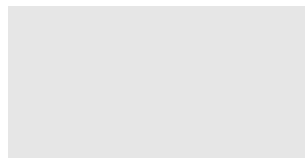

Figure 1: Participant flow diagram.

Table 1 shows baseline characteristics.

Characteristic	Value
Age, mean (SD)	58 (14)

Table 1: Baseline characteristics.

4. Discussion

This study was limited by its single-centre design.
