

This document isolates, one by one, every diagnostic case `checklist.pdf` must report. Compare each line below against the corresponding row of the rendered grid.

t1 — the normal case, no diagnostic expected:

Normal content, correctly covered.

t2 — never covered: row “t2” in the grid must show “⚠ item t2: not covered”.

t3 — blank content:

t4 — both `check()` and `na()` on the same id: the Page cell for “t4” must show the conflict diagnostic rather than silently picking a side.

Covered anyway.

t5 — `na()` declared twice for the same id: the Diagnostics block must list “na(“t5”) declared 2 times”.

t6/t7 — sharing the “Sub-group demo” group and the same Topic: check in the grid that the Topic cell is properly merged (rowspan) across both rows, under a single group header.

First item of the group demonstration. Second item of the same group, same topic.

An id entirely unknown to the “tiny” checklist, referenced once via `check()` and once via `na()`: the Diagnostics block must list both, each with the page where the offending call sits in this manuscript.

This id doesn’t exist in any grid — unknown id via `check()`.
