

1. Title and abstract

A cohort study of Exposure E and Outcome O among adults aged 40-70.

2. Methods

This was a prospective, single-centre cohort study.

Participants were adults aged 40-70 enrolled at a single clinic between 2018 and 2020, followed for 5 years.

Exposure status was assessed via structured interview at baseline; outcome status was ascertained from linked registry data.

3. Results

Of 2,400 eligible participants, 2,150 were enrolled and 1,980 completed follow-up (see Figure 1).

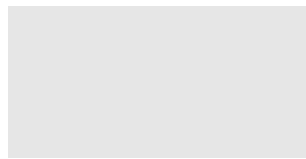

Figure 1: Participant flow.

212 outcome events were observed over the follow-up period.

4. Discussion

Exposure E was associated with a higher rate of Outcome O.
