

Title and abstract

Prevalence of condition C among adults attending primary care: a cross-sectional study. ^[1]

Methods

All adults attending the participating clinics during the study period were eligible. ^[6]

Analytical methods accounted for the clustered sampling strategy used to recruit clinics. ^[12]

Results

Condition C was present in 18% of participants. ^[15]

Discussion

These findings may not generalise beyond primary-care settings. ^[21]
